

Writeup

I created Maven project with testNg for the Swiggy application.("<http://127.0.0.1:4723/wd/hub>").afeter this in android studio I opened android emulator

With that I opened Appium gui for server connection to Appium inspector in that I set desired capabilities for swiggy .

```
{  
  "platformName": "Android",  
  "appium:platformVersion": "11",  
  "appium:appPackage": "in.swiggy.android",  
  "appium:appActivity":  
  "in.swiggy.android.activities.HomeActivity",  
  "appium:UDID": "emulator-5554"  
}
```

In the maven appi script first I written for homepage activity method in that I mentioned all desired capabilities after this I written second method called get started for starting the swiggy application, then I written mothed for mobile No and OTP generation in that after getting the otp we have to enter manually, then it will go for the mothed called continue, then written method called adding the location after this I written search method for searching the dishes after getting the items I go for the method called add cart after this final checking out box if it is items added cart or not.

For POM.xml file I added plugin for executing the test cases it will run the all test case successfully and generated the output.

Then I started server for Jenkins in that I created maven project after this I configured the POM.xml path for executing the whole test cases
